The AeroDawg* Canine Aerosol Chamber is designed to be used with a Metered Dose Inhaler (puffer) to deliver aerosol medication to canines with chronic bronchitis, chronic rhinitis, laryngeal paralysis or tracheal collapse.

The use of inhaled medication provides targeted delivery of medication to the lungs and reduces the side effects seen in dogs treated with systemic medications.\(^1\) Therapeutic effect can often be achieved with only a fraction of the dose required for systemic delivery of the same drug.\(^2\)

**Flow-Vu** Inhalation Indicator

The Flow-Vu** Indicator moves with inhalation and provides the caregiver with visual confirmation of the dog inhaling their medication. This is important because some dogs hold their breath when first introduced to the mask. The Flow-Vu* Indicator also allows the caregiver to count breaths and ensure a proper facemask seal.

**2 Mask Sizes**

Each device is shipped with 2 different sized facemasks. The mask should cover the nose and mouth. However, if not possible apply the mask to the dogs nostrils while gently holding the muzzle closed.

**Inhalation Valve**

Extra sensitive, low resistance valve is designed to respond to shallow, low volume breaths

**Anti-static Chamber**

Holds the medication allowing the dog more time to inhale

**Universal Backpiece**

Can be used with all commonly prescribed Metered Dose Inhalers (Note: not designed for use with Dry Powder Inhalers)
## Easy to Use

1. Remove cap and shake inhaler
2. Insert inhaler into back of chamber and gently apply the mask to the dog’s face
3. Press the inhaler to release the medication when the Flow-Vu® Inhalation Indicator is moving toward the dog and hold the mask in place for 5–6 breaths

### Metered Dose Inhaler Treatment

<table>
<thead>
<tr>
<th>DRUG</th>
<th>DOSE</th>
<th>USAGE</th>
<th>INDICATION</th>
</tr>
</thead>
</table>
| **Salbutamol**        | • 1-2 puffs (100 µg/puff) administered via AeroDawg® Chamber  
                         • Each Metered Dose Inhaler contains 200 puffs | • Use as needed, but not routinely  
                                    • In emergency cases, salbutamol can be used q30 minutes for up to 4 to 6 hours without serious side effects | Immediate relief of bronchoconstriction |
| **Fluticasone Propionate** | • Dogs <20 kg: 1 puff (125 µg) q12h administered via AeroDawg® Chamber  
                                • Dogs >20 kg: 1 puff (250 µg) q12h administered via AeroDawg® Chamber  
                                • Each Metered Dose Inhaler contains 120 puffs | Overlap with oral prednisolone for 2-3 weeks when starting since Flixotide Evohaler® takes 1-2 weeks to reach peak effect | Long-term control of airway inflammation |

### NOTES:
- If the dog gets frightened when pressing the inhaler, press the inhaler before placing the mask on the dogs muzzle. Note: this means the dog will receive a lower dose and may then require a second administration to guarantee they receive an adequate amount of medication.
- If the dog is treated with both fluticasone and salbutamol, the salbutamol should be given first.
- Although a number of additional corticosteroid drugs have been produced for inhaled administration, fluticasone is preferred, because it is the most potent and has the longest half-life.
- Some of the newer Metered Dose Inhalers include dose indicators. If not, owners are encouraged to keep track of puffs.
